Chapter 1 Reflective Questions – Orientation

	What different groups of people and organisations are there in your context who a generate and b) use evidence to improve education?					
<u>.</u>	Would you say that evidence-informed education is 'divided' in terms of how evidence					
2	understood and used? If so, what causes differences in approach and ethos? If not, ho

2.	understood and used? If so, what causes differences in approach and ethos? If not, ho					

3.	How would you characterise/define/group different ways of understanding and using evidence? Do you recognise the 'What works' (WW) and 'Educational Effectiveness and Improvement' (EEI) distinction made in the book? Who else and what other approaches
	are there? In what ways are evidence-informed education groups similar and different?
4.	The book describes high-quality evidence as being usable, relevant, rigorous, cogent and coherent. Are these the right criteria? What do you look for in evidence that has the best potential to improve education?

oday? Wh	at has change	d in the last	: 30 years?

we think a	re still relevan	t. Which of	these ques	tions do yc	u think is t	

7.	The book describes a general 'flatline' in educational standards in developed education systems. But it does argue that there are many examples of success to be found and the issue is mostly one of sustaining and scaling improvement. Do you agree with this generalisation? What do you think are the best examples of successful programmes practices and policies that we should look to as examples of successful improvement?
